

Editor's Comment:

I have thoroughly reviewed the reports of the reviewers and the responses of the author/s.

Based on my evaluation, I recommend the ACCEPTANCE of this manuscript given that the following recommendations be followed:

1. Improve the introduction section by adding recent literature on the study material. What has been studied so far? Indicate the justification for the research. What is the problem you sought to answer with this research? Is there any existing gaps in the literature?
2. HPLC means High-Performance Liquid Chromatography and not High-Resolution
3. The title should be: Phytochemical Comparison of stem and leaves of *Cupressus sempervirens* L. from Cuba
4. In the conclusion section, indicate whether which phytochemical constituent the leaves and stem differ and the same.

Please extend my felicitations to the author(s). On another note, if you can request the author/s to cite at least 1-2 articles from the Asian Journal of Biology, it would be much appreciated.
