

Editor's Comment:

Hey! Sou coordinator of a Committee of Ethics in Pesquisa with Human Beings (UENP / Paraná / Brazil). In the absence of avaliação and feedback from a Committee of Ethics, we are dealing with a retrospective study, as well as authorization by two participants (in this case of six respondents), inviabiliza publicação desta pesquisa, já that this fato does not allow its use in the form of appointment in other studies, less hair not Brazil.

This is an excellent study, with a relevant contribution to the child's health, especially the prevention of late bleeding, which can have serious consequences for babies, including death if not treated in time.

The researchers accepted most of the evaluators' considerations and requests.

Although this is a retrospective study, it is a study with Human Beings, which determines the analysis and approval of an Ethics Committee on Human Research.

Even after the event (case study), participants (or their legal guardians) should be aware of and agree with the disclosure of their data and be assured that they will not suffer any physical, moral or other harm.

The evaluation and feedback of the Human Research Ethics Committee is indispensable!

The awareness of researchers in this regard is fundamental!
