

Editor's Comment:

I have read the enclosed manuscript, in both original and revised versions. Despite of the Authors' intervention, the overall quality of the manuscript remains low, as the Authors have followed the Reviewers' suggestion to a very limited extent. The manuscript is somewhat prolix and repetitive, whereas some essential information is lacking into the Experimental section, such as a clear description of the sampling plan, owing to the hydrographic regime of the studied river, depending on the climate of its basin, with alternating rainy and dry seasons along every year. In conclusion, unless the Authors perform a deep and accurate revision of their work, the manuscript cannot be published. In particular the English language and style is unacceptable, to the extent that several sentences are hard to understand.
