

Editor's Comment:

The subject is a well-known work worldwide in pepper production, therefore poor working. On the other hand, it can contribute to Swaziland agriculture.

The total product amount has never been mentioned. When compared with control plants, the effect of production inputs is not considered. It costs 80 tons of fertilizer per hectare, but there is no significant difference with control plants. There are many more questions, therefore poor working. In addition to these, There are still typos in the line, 77,100,225,227,254,273,282. needs to be corrected. Although there is no benefit to pepper production in the world, it may be useful for Swaziland agriculture. It can be published after necessary corrections.

(Manuscript Title: Effects of Different Levels of Cattle Manure on Growth, Yield and Quality of Pepper (*Capsicum annum L.*) in a Sub-tropical Environment of Eswatini (Swaziland).
