

**SDI Review Form 1.6**

Journal Name:	<a href="#">International Journal of Environment and Climate Change</a>
Manuscript Number:	Ms_IJECC_61283
Title of the Manuscript:	Study Of Local Construction And Technique: Adequacy Of An Existing Nubian Vaulted Building With The "Bioclimatic" Concept Including The Performance Of Its Envelope In Sahelian Climate Of Ouagadougou
Type of the Article	Original Research Article

**General guideline for Peer Review process:**

This journal's peer review policy states that **NO** manuscript should be rejected only on the basis of '**lack of Novelty**', provided the manuscript is scientifically robust and technically sound. To know the complete guideline for Peer Review process, reviewers are requested to visit this link:

(<http://www.sciencedomain.org/journal/10/editorial-policy> )

**PART 1: Review Comments**

	Reviewer's comment	Author's comment (if agreed with reviewer, correct the manuscript and highlight that part in the manuscript. It is mandatory that authors should write his/her feedback here)
<b>Compulsory</b> REVISION comments	The article respects the structure of a scientific document. The study is interesting and useful, given the acceleration of sub-Saharan urbanization, designed to reduce the incidence of precarious housing for half the population. The approach of a bioclimatic housing model focuses on the concept of biourbanism. Specifically, wastewater recycling, the use of materials with a low coefficient of thermal retention, sustainable management of water sources, desalination of brackish water. The proposed living space has an interesting design and a satisfactory living area. For thermal comfort, the windows are undersized.	
<b>Minor</b> REVISION comments		
<b>Optional/General</b> comments	The article is interesting and can contribute to making appropriate decisions in order to ensure a good quality of housing "within the walls". Networks of forest protection curtains are welcome. (In the case of Romania, in the southwestern region, with sandy substrate, the moisture deficit is remarkable. The species adapted to edaphic dryness is <i>Robinia pseudoacacia</i> , a plant with a shield role, resistant to phenomena such as deflation and corrosion).
